

6420 Wide Head Conversion Kit

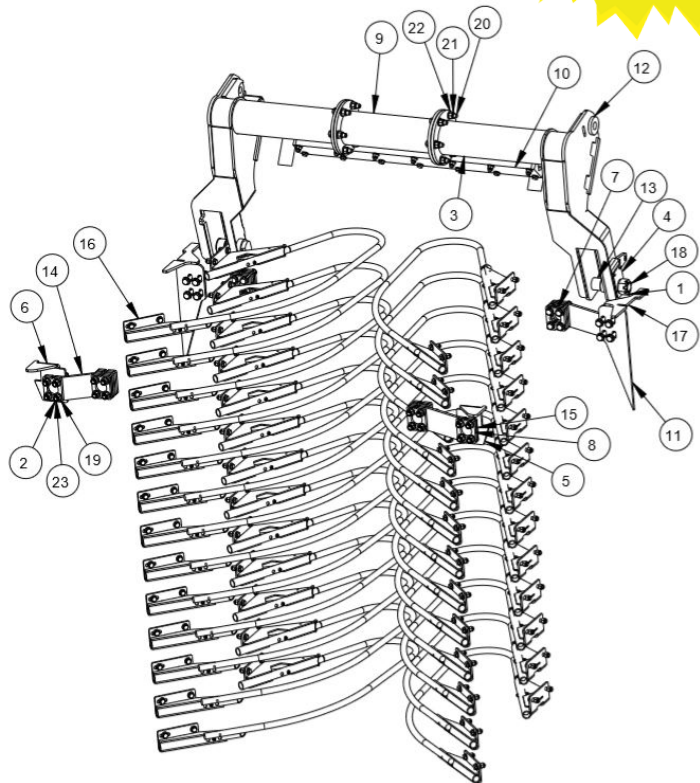

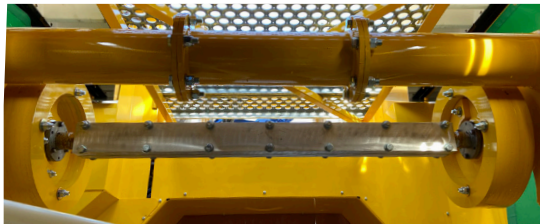

Kit Number: 166728

Oxbo has worked closely with customers and growers over the past few years to develop a new picking head for the 6430. This picking head is now available as a retrofit conversion for existing Oxbo 6420s. **The kit includes a split head frame design that allows the head to be positioned in both the standard and wide positions.**

The wide position features angled rod holders that change the profile and picking area on the rods, which has proven to dramatically reduce heat break, related to rod failures during harvest, and translates to lower operating cost and higher uptime. This configuration is ideal for large, mature olive trees and alternative SHD crops, as the head compresses the tree less than traditional picking systems. To pick younger, more flexible trees, rods can be stacked tighter in the picking zone to transfer more shaking energy into the tree to more effectively remove fruit.

The kit is extensive and initial installation will take 8 hours and includes new upper head mounts. Full instructions are available from your Oxbo dealer.

Kit includes all the parts shown here:
